

Long or short the memes nobody else will list. Up to 15x leverage on Robinhood Chain. Isolated margin. Liquidations you can see coming.

THE ONE-LINE THESIS The house pays out less than it costs to rob the house.

Every drained perp venue (Drift roughly \$285M, Mango roughly \$110M, the JELLY squeeze on Hyperliquid's HLP) died the same way: the protocol would pay out more than it cost to move a thin asset's price. THE PIT inverts that inequality at the contract level and enforces it as an invariant. That is why it can list what nobody else dares: leveraged perps on memecoins.

WHAT IT IS

A GMX-v2-style oracle-execution perps DEX on Robinhood Chain (Arbitrum Orbit L2, chain id 4663). No orderbook, no spread: every trade executes against an ERC-4626 LP vault (PLP) at the oracle mark. Isolated margin, USDG collateral, mcap-tiered leverage locked at listing, skew-based funding, a provably fair casino layer, and a fixed-supply token (\$PIT) burned with real fee revenue.

WHY IT WINS

01 Structurally safe memecoin perps (the moat)

Multi-oracle stack: the median of Chainlink and Pyth for majors, manipulation-resistant multi-pool TWAPs for memecoins, pairwise deviation guards, and a spot-versus-TWAP breaker that PAUSES opens and liquidations during manipulation. Per market, the sum of all capped payouts stays below the measured cost of moving that market's price, divided by a safety factor; per position, payout is capped at 9x margin. Manipulation is negative-EV by construction. Single-thin-pool tokens are never listed; there is no admin path to a price; every setter sits behind a 2-day timelock. The Drift, Mango, and JELLY attacks have no first step here.

02 The LP vault is the house, paid in real revenue

PLP earns trader losses as counterparty, a 20% carve of every trade fee, 40% of every liquidation penalty, the skew-funding residual, the vol-scaled borrow fee both sides pay, and 100% of the vol-scaled open surcharge (all current parameters). Real revenue to NAV, not emissions. Exposure is capped per market, floored by solvency rules, backed by an insurance fund plus bounded ADL.

03 Liquidations you can see coming, with up to 15x

Closed-form liquidation prices on the ticket, warnings at 50% and 75% of the distance, one-tap add-margin in every market state. Liquidation takes a bounded 1% penalty and returns the rest. Leverage scales with market cap: 4x on the thinnest coins up to 15x on majors, locked at listing. Max loss is always your margin; max win is printed on the ticket (up to 9x margin).

04 The casino layer

Sportsbook x terminal x Vegas neon-noir. Pit Points mint on fees paid (wash volume pays full freight): a non-transferable activity ledger with no monetary value and no entitlement to tokens. VRF-verified Pit Boss spins, a jackpot fed by 25% of every trade fee, 7-day seasons on a permanent ledger.

CONVEXITY IS PRICED TWICE: THE STRADDLE HARVEST IS NOT FREE

At open: a vol-scaled surcharge (100% to the vault), tighter fresh-market caps (1% of TVL per day over 14 days), and a vol-scaled cap discount. While holding: the vol-scaled borrow fee both sides pay. Real-stack PoCs against the shipped contracts:

Open-into-a-spike straddle, per cycle	+30.20 → -0.89 USDG
Vault captures per attempted cycle	~31.9 USDG
Patient calm-open-then-hold straddle	+387.64 → -511.62 USDG
Vol-borrow owed by the winning leg alone	~899 USDG

CURRENT PARAMETERS AT A GLANCE

LEVERAGE BY MCAP TIER	4x / 6x / 6x / 8x / 10x / 15x, locked at listing
PAYOUT CAP	9x margin per position
PER-MARKET CEILING	min(cost-to-move / safety factor, 10% TVL)
TRADE FEES	5 bps majors, 10 bps memes + vol surcharge
FEE SPLIT (IMMUTABLE)	25 jackpot / 10 referral / 20 vault / 25 buyback / 20 treasury
LIQ. PENALTY	1% notional: 20 keeper / 40 vault / 40 insurance
FUNDING AT FULL SKEW	0.25%/h memes, 0.05%/h majors + vol-borrow
VAULT WITHDRAWALS	24h epoch queue, 25% TVL cap, 1.2x solvency floor
\$PIT SUPPLY	1,000,000,000 fixed; burn-only via revenue buybacks
\$PIT ALLOCATION	30 public (liquid at TGE) / 50 community reserve (max 12%/yr, unspent burns at yr 4) / 15 treasury + community / 5 team (3-mo cliff, vested by mo 6)

SECURITY POSTURE

TDD with wei-exact conservation proofs, fuzzing, invariant harnesses, Slither and Aderyn in CI: **732 tests green**. Internal adversarial gauntlet: twelve parallel attacker specialists, chief consolidation, test-first fix waves, adversarial re-audit, and an economics re-audit. Perp-wave verdict: no drain, no fund lock, no reserve desync, conservation exact on every path. External audit, fork live-fire replays of the historical attacks, bug bounty, and a capped guarded launch precede mainnet value: zero funds are accepted until the audit lands.

\$PIT IN ONE LINE

Fixed 1B supply; 25% of every trade fee funds buyback-and-burn (the immutable on-chain split, with 20% to treasury); staking unlocks fee-tier discounts, jackpot boosts, and vault-yield boosts. Issued by an offshore Foundation, geofenced. The community reserve releases at most 12% of total supply per rolling year, and whatever is undistributed four years after TGE is burned; who earns it stays at the Foundation's discretion, and no individual distribution is promised.
